Adarsh Singh

LinkedIn: www.linkedin.com/in/adarsh0303 Email: adarshsingh629910@gmail.com GitHub: https://github.com/AdarshSingh062 Mobile: +91 9369031859

SKILLS

Languages: C++, Python, C, DSA
Frameworks: HTML, CSS, JS(React)
Tools/Platforms: DBMS, Power BI, Excel, MS SQL Server
Soft Skills: Problem-Solving, Team Management, Time Management, Adaptability
Extracurricular activities: Drawing & Painting, Volunteered for NGO, Cricketer (District level)

PROJECTS

Real-Time Smart Traffic Signal Controller | GitHub — May' 25

- Detects the number of vehicles or traffic density using cameras or image data. This ensures the system understands real-time road conditions accurately.
- Automatically adjusts green-light and red-light timings based on traffic load. This reduces long waiting times and improves traffic flow smoothly.
- Helps prevent congestion during peak hours and increases road efficiency. It creates a smart, adaptive traffic system using IoT and machine learning.

Student Performance Prediction System | GitHub — Apr' 25

- Collects student details like attendance, assignment scores, and internal marks. This data helps understand study habits and academic behavior clearly.
- Uses a machine learning model to predict whether a student may pass or struggle. Early predictions help teachers identify students who need extra support
- Shows results on a simple web-based dashboard with charts and indicators. Teachers can track overall performance trends and generate helpful reports.

Real-Time Object Detector | GitHub — Sept' 24

- Detects various objects such as people, vehicles, animals, or items using live camera input. The system processes video frames instantly to identify objects as they appear.
- Uses deep learning models like **YOLO**, SSD, or **Mobile Net** for fast and accurate detection. These models help the system recognize multiple objects at once with high precision
- Can be used in applications like security monitoring, traffic analysis, and automation. Its ability to detect and track objects in real time makes it highly useful in real-world scenarios.

TRAINING

Advanced Data Structure using C++ | Lovely Professional University — Jun' 24 – Jul' 24

- Performed Exploratory Data Structure using C++, leading to build basic logic and 30% reduction in code optimal preprocessing time.
- Implemented Segment Trees, Fenwick trees (BIT), and Disjoint Set Union (Union-Field) with path compression
- Learned algorithmic patterns: Sliding Windows, Two Pointers, Divide & Conquer, Binary Search on Answer

CERTIFICATES

- *Java Fundamentals* | *Cipher Schools* | Link — May' 25
- Computer Architecture | Coursera | Link — Apr' 25

- Computer Networks | Coursera | Link — Oct' 24

EDUCATION

Lovely Professional University — Phagwara, Punjab
Bachelor of Technology — Aug' 23 – Present
Computer Science and Engineering; CGPA: 7.0

Casterbridge School — Ballia, Uttar Pradesh
Intermediate — Mar' 21 – May' 22
PCM; Percentage: 74 %

Casterbridge School — Ballia, Uttar Pradesh
Matriculation — Mar' 19 – May' 20
Percentage: 83%
